

TurboSwing, everyone can ski!

The TurboSwing is a very intelligent solution which transforms almost any boat with an outboard into a real ski boat. The system is extremely simple because it consists of a tow bar that you mount on the motor bracket so that the line runs around it. A pulley runs around on the tow bar, which is itself attached to the ski rope, so it is possible to draw a fixed point and adjusts to the movements of the skier. Extremely easy to install, the TurboSwing is detachable in a couple of seconds and does not affect the engine trim. Moreover, he ensures that the space in the boat keeps fully preserved. With an ease of use, the TurboSwing is suitable for all forms of skiing, from regular skiing to tubing and wakeboarding to parasailing, not only for beginners but also for advanced skiers. In addition, the height of the traction point increases, which is an advantage for the skier. Endorsed by professionals, the system is officially recognized by the French Water-ski- and Wakeboard Federation, led by World champion Patrice Martin. The manufacturer reports that its system, thanks to its flexibility, also leads to lower fuel consumption. The TurboSwing is suitable for all outboards from 30 to 350 hp, regardless of brand, and is sold between € 359, - and € 899 (twin engines), depending on the engine. **More information on www.turboswing.com.**

HE SAID IT...

Patrice Martin
12-time World champion
waterskiing

Like everyone, I began with my training behind a family boat with an outboard.

Then I trained for years with specialized ski boats (inboard). However, I regularly found my comrades, and an afternoon at sea with a boat with an outboard was always very relaxed. Only a water skiing ride, the ski rope, the engine, with or without ski pole and for not getting into trouble you had to choose between a soft ski rope or a make a sport of steering.

TurboSwing offers an innovative forward-looking product aimed at comfort for everyone. It offers interesting perspectives for almost everybody when practicing waterskiing.

With the type of installation, the system applies to any outboard engine, provides the necessary stability and traction for skiers at all levels, and thereby ensures more steering convenience.
